▷ Define or modify generic function *foo*. Remove any methods previously defined by defgeneric. *gf-class* and the lambda paramters *required-var** and *var** must be compatible with existing methods. *defmethod-args* resemble those of *m*__defmethod__. For *c-type* see section 10.3.

(*f*__ensure-generic-function__ { *foo* | (__setf__ *foo*) } ({ __:argument-precedence-order__ *required-var*+ | __:declare__ (__optimize__ *method-selection-optimization*) | __:documentation__ *string* | __:generic-function-class__ *gf-class* | __:method-class__ *method-class* | __:method-combination__ *c-type c-arg** | __:lambda-list__ *lambda-list* | __:environment__ *environment* })
▷ Define or modify generic function *foo*. *gf-class* and *lambda-list* must be compatible with a pre-existing generic function or with existing methods, respectively. Changes to *method-class* do not propagate to existing methods. For *c-type* see section 10.3.

▷ Define new method for generic function *foo*. *spec-var*s specialize to either being of *class* or being **eql** *bar*, respectively. On invocation, *var*s and *spec-var*s of the new method act like parameters of a function with body $form^*$. *form*s are enclosed in an implicit $_s$**block** *foo*. Applicable *qualifier*s depend on the **method-combination** type; see section 10.3.

($\left\{\begin{array}{l} {}_g\textbf{add-method} \\ {}_g\textbf{remove-method} \end{array}\right\}$ *generic-function method*)

10.3 Method Combination Types

standard

▷ Evaluate most specific **:around** method supplying the values of the generic function. From within this method, $_f$**call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, call all **:before** methods, most specific first, and the most specific primary method which supplies the values of the calling $_f$**call-next-method** if any, or of the generic function; and which can call less specific primary methods via $_f$**call-next-method**. After its return, call all **:after** methods, least specific first.

and|**or**|**append**|**list**|**nconc**|**progn**|**max**|**min**|**+**

▷ Simple built-in **method-combination** types; have the same usage as the *c-type*s defined by the short form of $_m$**define-method-combination**.

($_m$**define-method-combination** *c-type*

$\left\{\begin{array}{l} \widehat{\textbf{:documentation}\ string} \\ \textbf{:identity-with-one-argument}\ bool_{\boxed{\mathtt{NIL}}} \\ \textbf{:operator}\ operator_{\boxed{c\text{-}type}} \end{array}\right\}$)

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, $_f$**call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, return from the calling **call-next-method** or from the generic function, respectively, the values of (*operator* (*primary-method gen-arg**)*), *gen-arg** being the arguments of the generic function. The *primary-method*s are ordered [{**:most-specific-first** | **:most-specific-last**} **:most-specific-first**] (specified as *c-arg* in $_m$**defgeneric**). Using *c-type* as the *qualifier* in $_m$**defmethod** makes the method primary.

($_m$**define-method-combination** *c-type* (*ord-λ**) ((*group* {***** | (*qualifier** [*****]) | *predicate*} {| **:description** *control* | **:order** {**:most-specific-first** | **:most-specific-last**} **:most-specific-first** | **:required** *bool*}*)* {| (**:arguments** *method-combination-λ**) | (**:generic-function** *symbol*) | (**declare** *decl**)* | *doc*} *body*^{P}*)

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body** with *ord-λ** bound to *c-arg** (cf. $_m$**defgeneric**), with *symbol* bound to the generic function, with *method-combination-λ** bound to the arguments of the generic function, and with *group*s bound to lists of methods. An applicable method becomes a member of the leftmost *group* whose *predicate* or *qualifier*s match. Methods can be called via $_m$**call-method**. Lambda lists (*ord-λ**) and (*method-combination-λ**) according to *ord-λ* on page 17, the latter enhanced by an optional **&whole** argument.

($_m$**call-method** {*method* | ($_m$**make-method** *form*)} [({*next-method* | ($_m$**make-method** *form*)}*)])

▷ From within an effective method form, call *method* with the arguments of the generic function and with information about its *next-method*s; return its values.

11 Conditions and Errors

For standardized condition types cf. Figure 2 on page 31.

($_m$**define-condition** *foo* (*parent-type** **condition**) ({*slot* | (*slot* {{**:reader** *reader*}* | {**:writer** {*writer* | (**setf** *writer*)}}* | {**:accessor** *accessor*}* | **:allocation** {**:instance** | **:class**} **:instance** | {**:initarg** *:initarg-name*}* | **:initform** *form* | **:type** *type* | **:documentation** *slot-doc*})}*) ({| (**:default-initargs** {*name value*}*) | (**:documentation** *condition-doc*) | (**:report** {*string* | *report-function*})})

▷ Define, as a subtype of *parent-type*s, condition type *foo*. In a new condition, a *slot*'s value defaults to *form* unless set via **:***initarg-name*; it is readable via (*reader i*) or (*accessor i*), and writable via (*writer value i*) or (**setf** (*accessor i*) *value*). With **:allocation :class**, *slot* is shared by all conditions of type *foo*. A condition is reported by *string* or by *report-function* of arguments condition and stream.

▷ Unless handled, signal as correctable **error** *condition* or a new instance of *condition-type* or, with *f***format** *control* and *arg*s (see page 36), **simple-error**. In the debugger, use *f***format** arguments *continue-control* and *continue-arg*s to tag the continue option. Return NIL.

▷ Globally make declaration(s) *decl*. *decl* can be: **declaration**, **type**, **ftype**, **inline**, **notinline**, **optimize**, or **special**. See below.

(**declare** *decl**)
▷ Inside certain forms, locally make declarations *decl**. *decl* can be: **dynamic-extent**, **type**, **ftype**, **ignorable**, **ignore**, **inline**, **notinline**, **optimize**, or **special**. See below.

(**declaration** foo*)
▷ Make *foo*s names of declarations.

(**dynamic-extent** *variable** (**function** *function*)*)
▷ Declare lifetime of *variable*s and/or *function*s to end when control leaves enclosing block.

([**type**] *type variable**)
(**ftype** *type function**)
▷ Declare *variable*s or *function*s to be of *type*.

({**ignorable** / **ignore**} {*var* / (**function** *function*)}*)
▷ Suppress warnings about used/unused bindings.

(**inline** *function**)
(**notinline** *function**)
▷ Tell compiler to integrate/not to integrate, respectively, called *function*s into the calling routine.

(**optimize** { **compilation-speed** | (**compilation-speed** *n*[3]) | **debug** | (**debug** *n*[3]) | **safety** | (**safety** *n*[3]) | **space** | (**space** *n*[3]) | **speed** | (**speed** *n*[3]) })
▷ Tell compiler how to optimize. $n = 0$ means unimportant, $n = 1$ is neutral, $n = 3$ means important.

(**special** *var**) ▷ Declare *var*s to be dynamic.
